

2 ITF/ACS - Professional skills 2

Competency Communication: 'You train and support end users.'

Basic concept for your training session

The students giving the training (first name and last name)

- student 1: Stijn Rombouts
- student 2: David Maat

Location and time of the training session

- day of the week + date: Monday 4/5/2026
- starting and ending time: 16:00 - 17:30

Subject (What is the training about?)

Data essentials modelling and SQL basics

Concrete objectives (What should the trainees be able to do after having attended the training?)

Describe this VERY CONCRETELY and PRECISELY

- The students should understand what data is, how to make a data model and how to write basic SQL to make and query data from said model

The trainees who will take the training

- profile: DI4D student who have failed the data essentials course
- number of trainees who will take the training: 4

Expected prior knowledge/experience of the trainees (What do they need to know and/or be able to do beforehand in order to follow the training successfully? Describe this very concretely).

- All of the students have experience with the course, but they failed. Two of the students have prior knowledge with IT in general. No prior knowledge is necessary for the course.

Overview of the activities that will be dealt with successively during the training.

Describe this very concretely including time indication!

Don't just list the subjects that will be dealt with. Don't just mention what you will do as 'trainer', but **also what the trainees will do** during the training. Provide a **detailed overview of everything that will be done successively during the training, and by whom**.

- We will briefly introduce ourselves. 1-2 mins.
- We check that all the students have staruml, mysql and mysql workbench installed.
- We will outline what topics we will cover during the session.
- We will explain the structure of a data model, what all the components are and how they relate to each other.
- We will explain how to read a question for creating a data model. Explaining how to identify the important parts.
- We will present an exercise where the students have to identify what each part of a data model is.
- We will present an exercise with a simple case study to create a data model.

- We will explain how the data model relates to the tables in mysql.
- We will explain the structure of an sql query.
- We will present a basic data model and an exercise on how to query it.
- We will explain the scalar functions and apply them to the previous exercise.
- We will explain the set-functions and apply them to the previous exercise.

Infrastructure and equipment needed to deliver the training.

- Laptops, beamer.
